SANITATION - SEWAGE TREATMENT

ZEBRON® coatings have been specified and installed in several projects by the California Orange County Sanitation Districts. Most of the structures coated were badly corroded by sulfuric acid and industrial wastes. Since its first use in 1977, ZEBRON® coatings have been used on various major projects including:

- 20 concrete structures on the 78 inch Miller-Holder Trunk.
- over 120 manholes on the Euclid Trunk.
- over 150 manholes in other areas, concentrated in places where industrial effluents containing acids had attacked the concrete.
- a digester in No. 1 Treatment Plant.
- a digester including hatch covers and overflow sink and large sedimentation tanks at No. 2 Treatment Plant. Also, two junction structures at this location.

ZEBRON® is completely impervious to deterioration from hydrogen sulfide, sulfuric acid and other acids found in sewage and wastes. These applications, and many others in sewage treatment plants and industrial plants, attest to the complete protection from corrosion given to steel and concrete structures and equipment by ZEBRON® Protective Coatings.
